

WAG Lab -- Three Ways to Tell the Same Story

A print-and-talk-about-it draft for Angelina, Bella & Scarlett

What this is: the exact same real slime recipes and your real banter, laid out three different ways. Nothing is decided yet -- we want your honest reaction before anything gets finalized.

As you read each one, think about:

- Which one do you want to keep reading?
- Which one sounds most like something you'd actually say?
- Does the "mission/badge" idea (Format B) feel fun or forced?
- Does the "case file/mystery" idea (Format C) feel cool or confusing?
- Which one would you want your friends to see?

FORMAT A -- WAG Lab Companion

The system as it already exists today, unchanged.

Classic Slime

Have you ever wanted to make slime so big you could hug it?

Biggest Fluffy Slime

Today we're going gigantic. Not regular fluffy slime -- the biggest, squishiest, most enormous fluffy slime you've ever made.

[PHOTO -- hands stretching a huge mound of fluffy slime]
Psst -- Wobbie's hiding somewhere on this page. Can you find him?

OVERHEARD WHILE MIXING

Scarlett: "Wait, is this ALL glue?"

Angelina: "Oh yeah baby -- let's do this!"

Annabella: "Whoa. That's a LOT of glue."

WHY IT WORKS

Shaving cream isn't just foam -- it's millions of tiny air bubbles trapped in soap. Fold it into glue and those bubbles stay put.

What You'll Need

- Clear or white glue
- Shaving cream (lots of it!)
- Baking soda
- Contact lens solution

DID YOU KNOW?

Fluffy slime is really foam chemistry -- trapped air bubbles act like tiny pillows.

Let's Get Started

1. Pour your glue into a big bowl.
2. Add a giant mountain of shaving cream and fold it in gently.
3. Add food coloring if you want, and mix until smooth.
4. Add baking soda, then contact lens solution, mixing until it stops sticking.

WHOA MOMENT

This is the part where it stops feeling like glue and starts feeling like a cloud. "I just want to hug it."

SECRET SLIME CODE -- Letter: F

What makes shaving cream fluff up slime? A) Sugar B) Tiny trapped air bubbles C) Nothing
Get it right, write down the letter. Collect them all to crack the code!

FORMAT B -- WAG Lab Missions

Adds Lab Ranks and badges -- Claude's current working hypothesis, not decided.

Edible Slime

MISSION 04 -- Objective: Extract stretchy slime from a bag of gummy bears

Have you ever made slime you're actually allowed to eat?

Gummy Bear Slime

This one starts with a whole bag of gummy bears, sorted by color -- and ends with real, stretchy, edible slime made entirely out of melted candy.

[PHOTO -- three girls in chef hats stretching golden gummy slime]

OVERHEARD WHILE MIXING

Annabella: "You smell amazing! I cannot wait to eat this."

Scarlett: "First one to unfreeze a gummy bear wins."

WHY IT WORKS

Gummy bears are mostly gelatin. Heat melts it into a stretchy liquid; cornstarch and powdered sugar thicken it back up as it cools.

What You'll Need

- A bag of gummy bears, sorted by color
- Cornstarch
- Powdered sugar

Complete the Mission

1. Sort your gummy bears by color into separate bowls.
2. Microwave each bowl about 45 seconds, until melted.
3. **Ask an adult for help** -- the melted candy will be very hot.
4. Mix melted gummies together until smooth.
5. Add cornstarch and powdered sugar, kneading until not sticky.

MISSION COMPLETE

You just earned your **Slime Explorer** badge. 3 more missions to reach **Lab Master**.

MISSION INTEL -- Letter: U

What protein in gummy bears makes this work? A) Gelatin B) Gluten C) Keratin
Collect intel from every mission to crack the code!

FORMAT C -- The Secret Slime Files

The mystery becomes the main story, not just a side puzzle.

WAG LAB CASE FILE -- CASE #07: THE GLOW

Something in the lab glows under black light. The girls need to find out what -- and why.

Glow-in-the-Dark Snow Cone Slime

Grab a black light -- this one only shows its real colors in the dark. Three bowls, three neon glows, and a snow-cone twist at the end.

[PHOTO -- three neon slimes glowing under black light]

OVERHEARD WHILE MIXING

Annabella: "Whoa -- that looks like the ocean, but neon!"

Scarlett: "Wait, your hair is glowing green now!"

What You'll Need

- Clear Elmer's glue
- Glow-in-the-dark neon paint (3 colors)
- A black light

LAB ANALYSIS

This isn't ordinary glow-in-the-dark -- it's **fluorescence**. The paint absorbs invisible UV light and fires it back out as bright color. Case status: solved.

Run the Experiment

1. Pour glue into three separate bowls.
2. Add a different glow color to each bowl.
3. Activate with baking soda and contact lens solution.
4. Turn off the lights, turn on the black light, and watch it glow.

CASE EVIDENCE -- Letter: G

What's the real name for this glow? A) Phosphorescence B) Fluorescence C) Bioluminescence

Case file so far: F _ _ _ _ _ (7 of 26 clues logged)
